

Your Heart Health Summary

Date: 2026-10-05 11:39:36 UTC

1. What this summary is

This summary describes the numbers you entered and what a computer model predicted from them. It shows the calculated risk numbers for your heart arteries based on those measurements.

2. Overall picture

The computer model evaluated your overall probability for coronary artery disease (CAD), which is narrowing in the blood vessels that supply blood to your heart muscle. The model estimated an overall predicted probability of 13%, placing this estimate in the low range.

3. Your three main heart arteries

Left Anterior Descending (LAD) Artery 12% ● Low

The LAD artery runs down the front of the heart and supplies blood to the front wall. The model calculated a predicted narrowing probability of 12%, which is in the low category.

Left Circumflex (LCX) Artery 14% ● Low

The LCX artery curves around the left side of the heart to nourish the side and back walls. The model calculated a predicted narrowing probability of 14%, which is in the low category.

Right Coronary (RCA) Artery 14% ● Low

The RCA artery travels down the right side of the heart to bring blood to the right chambers and underside. The model calculated a predicted narrowing probability of 14%, which is in the low category.

4. Your measurements

Body and Clinical Examination

Measurement	Your value	Typical range	Status
Age	38.0 years	18-75 years	Within range
Blood Pressure (systolic)	110.0 mmHg	90-120 mmHg	Within range
Resting Heart Rate	70.0 beats/min	60-100 beats/min	Within range

Heart Tracing (ECG)

Measurement	Your value	Typical range	Status
ST-Segment Elevation	Absent	Absent	Within range
ST-Segment Depression	Absent	Absent	Within range

Blood Tests

Measurement	Your value	Typical range	Status
Fasting Blood Sugar	80.0 mg/dL	70-99 mg/dL	Within range

Measurement	Your value	Typical range	Status
Triglycerides	41.0 mg/dL	50–150 mg/dL	Within range
Kidney Marker (Creatinine)	0.6 mg/dL	0.6–1.2 mg/dL	Within range

Heart Ultrasound (Echocardiogram)

Measurement	Your value	Typical range	Status
Heart Pumping Fraction (EF)	60.0%	55–70%	Within range

5. What influenced the prediction most

Typical Exertional Angina: Absent: 0 pushed the predicted risk down.

Typical Exertional Angina: Present: 0 pushed the predicted risk down.

Patient Age: 38.0 years pushed the predicted risk down.

Atypical N: N pushed the predicted risk up.

6. About this estimate

This estimate was calculated by a computer program trained on past health data from hospital patients. It produces statistical probability numbers based on patterns in your measurements. The computer program does not take pictures of your heart or directly measure blood flow.

Predictions are for decision-support and educational purposes only and are not a substitute for formal diagnostic imaging or professional medical evaluation.
